1. Objective

Allow POS agents to add new items to an existing customer order instead of creating a new order when the customer already has an eligible **Pending or Confirmed** order.

2. Business Requirement

When an agent enters a customer's phone number in POS, the system should display the customer's existing orders.

- **Pending/Confirmed orders:** Agent can add new items.
- **Processing/Post-Processing orders:** Orders are visible but cannot receive additional items.
- Adding items to an eligible order updates the existing order rather than creating a new order.

3. Scope

- Search existing orders using the customer's phone number.
- Display existing orders associated with the phone number.
- Allow additional items to be added to **Pending** and **Confirmed** orders.
- Prevent additional items from being added to **Processing and post-Processing** orders.
- Update the existing order with newly added items and the revised total price.
- Maintain the original order ID/number and original order owner.
- Assign **Extra Bucket credit** for newly added items to the agent who added them.
- Do not assign **Confirm credit** for newly added items.
- Do not assign Extra Bucket credit for newly added items to the original order-owner agent.
- Reflect the updated order value in order reports.

4. Out of Scope

- Creating a separate new order when an eligible existing order is selected.
- Changing the original order owner or ownership history.
- Adding new items to Processing or post-Processing orders.
- Changing the workflow/stage of the existing order as part of this feature.
- Recalculating, transferring, or modifying credits associated with previously existing items.
- Assigning Confirm credit to the agent who adds additional items.
- Assigning Extra Bucket credit for newly added items to the original order-owner agent.
- Changing existing order pricing, discount, payment, or delivery rules unrelated to the newly added items.
- Modifying existing customer or order information unless required as part of the normal item-addition flow.
- Changes to existing credit/bucket calculation rules unrelated to additional items.

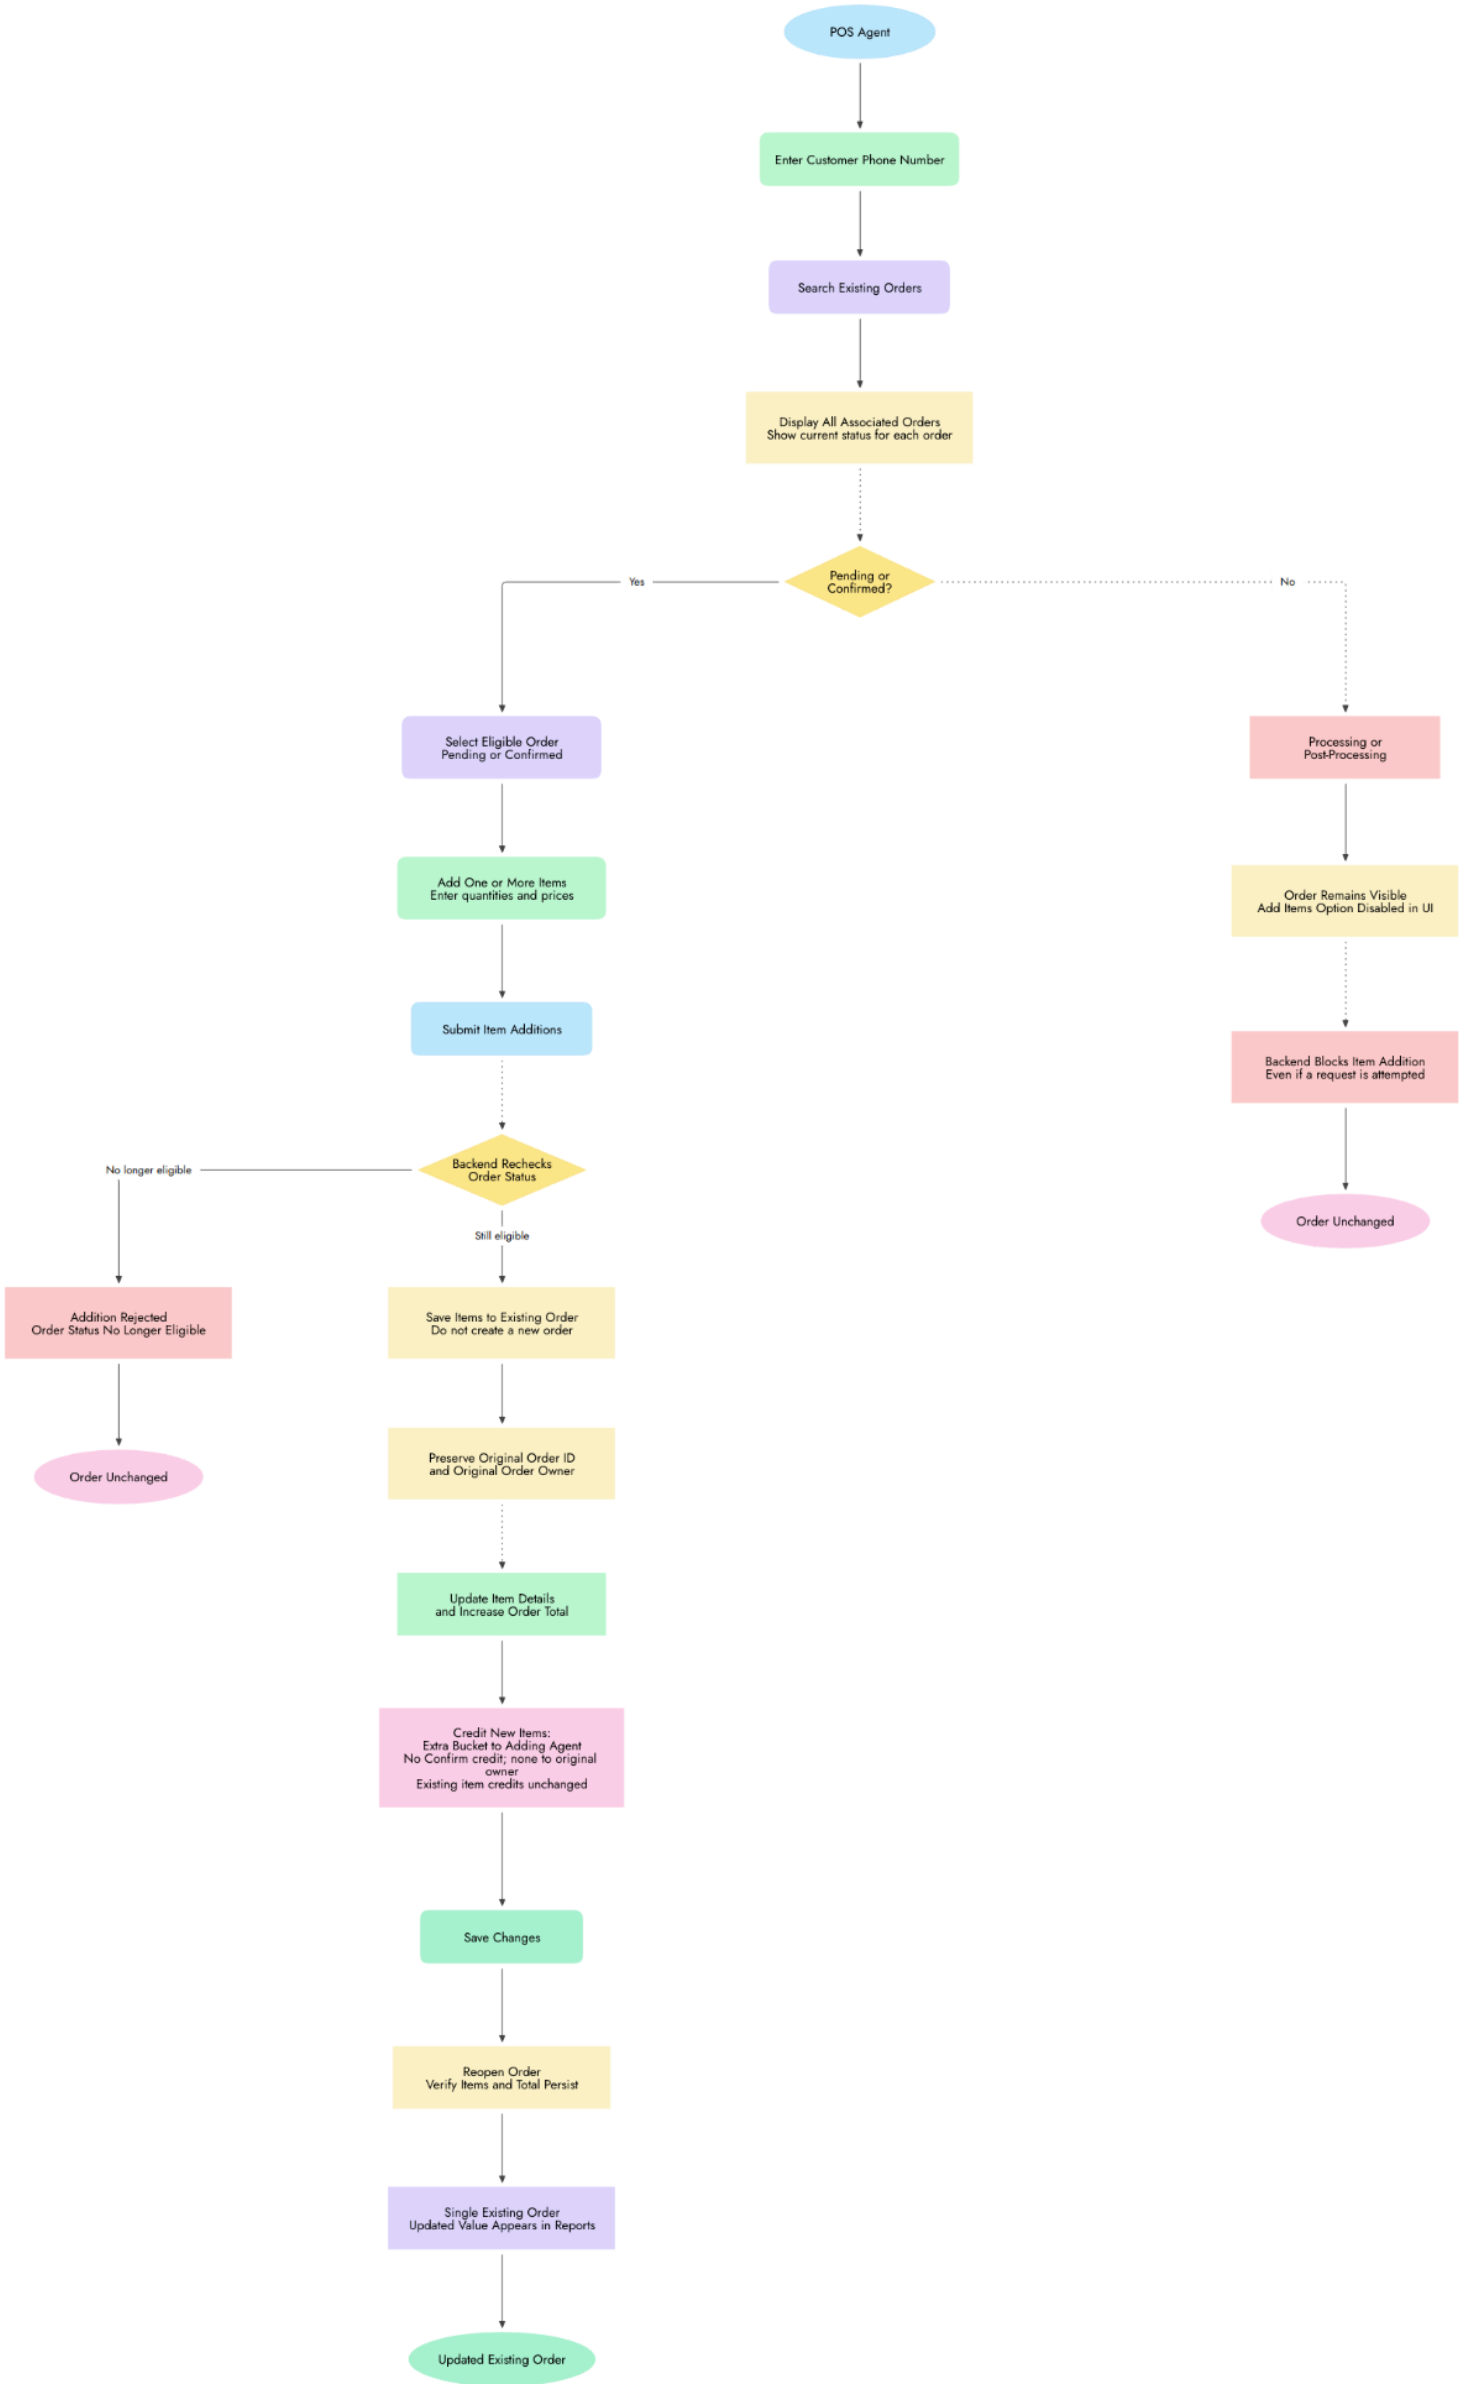

5. Assumptions

- Customer phone number is the primary identifier for finding existing orders.
- A customer may have multiple orders associated with the same phone number.
- Only orders associated with the entered phone number will be displayed.
- **Pending** and **Confirmed** orders are eligible for adding items.
- **Processing** and all stages after Processing are locked for additional items.
- The agent adding items can be identified through their POS login/session.
- Existing credit records are not affected when additional items are added.
- Adding items does not change the existing order's workflow stage unless separately defined.

6. Expected Flow

POS → Enter Customer Phone Number → Search Existing Orders → Display Orders Associated with Phone Number → Check Order Status

User Flow Diagram:

7. Business Outcomes

- Reduce duplicate orders for the same customer.
- Allow agents to consolidate additional customer purchases into an existing eligible order.
- Improve order management and customer purchase tracking.
- Reduce manual effort for agents when customers want to add products to an existing order.
- Maintain clear ownership of the original order while correctly crediting the agent who adds additional items.
- Improve accuracy of order totals and reporting.
- Provide a consistent process for handling additional purchases from existing customers.
- Prevent modifications to orders that have already entered Processing or later stages.

8. Acceptance Criteria

- **Order Search:** When an agent enters a customer phone number, the system displays all relevant existing orders associated with that number.
- **Order Status:** Each displayed order clearly shows its current status/stage.
- **Eligible Orders:** Pending and Confirmed orders have an available option to add new items.
- **Locked Orders:** Processing and post-Processing orders are displayed but do not provide an option to add items.
- **Add Items:** The agent can select an eligible order and add one or more new items.
- **Existing Order:** Newly added items are saved against the selected existing order.
- **No Duplicate Order:** Adding items does not create a new order.
- **Order ID:** The original order number/ID remains unchanged.
- **Order Owner:** The original order owner remains unchanged.
- **Order Total:** The existing order's total price is increased by the value of the newly added items.
- **Item Details:** Newly added items, quantities, prices, and applicable values are correctly reflected in the existing order.
- **Extra Bucket Credit:** The agent who adds the new items receives Extra Bucket credit according to the applicable rules.
- **Confirm Credit:** The agent who adds new items does not receive Confirm credit for those items.
- **Original Agent Credit:** The original order-owner agent does not receive Extra Bucket credit for the newly added items.
- **Existing Credits:** Credits associated with the original order items remain unchanged.
- **Order Report:** The updated total order value is correctly reflected in reports.
- **Single Order Reporting:** The original order continues to appear as one order after additional items are added.
- **Locked Order Protection:** The system prevents item addition through the UI and backend for Processing/post-Processing orders.
- **Data Persistence:** After saving and reopening the order, all newly added items and the updated total are retained.
