Business Requirements Document (BRD)

Add Product Filter to Agent Performance Details

Module: Reports → Agent Performance → Agent Performance Details

Author:

Falaq Food

1. Objective

Add a **Product** filter to the Reports → Agent Performance Details page so the Operations team can analyze agent performance and order details for a specific product.

2. Business Requirement

The Agent Performance Details page should include a Product filter that allows users to select a product and view performance metrics and order details associated with that product.

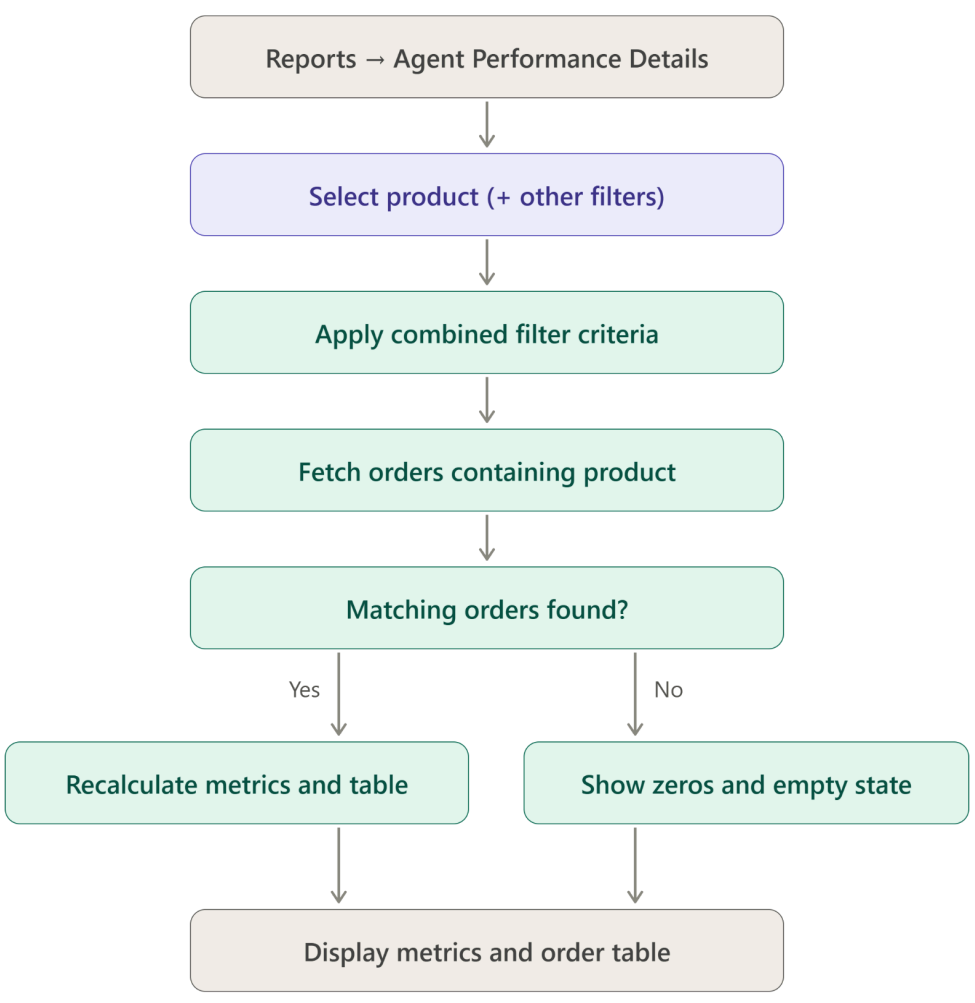

When a product is selected, all existing metrics on the page must recalculate based on the filtered order data. The table should display only orders that contain the selected product.

The Product filter must work in combination with all other available filters on the page.

3. Expected Flow

Reports → Agent Performance Details → Select Product → Apply Combined Filters → Recalculate All Metrics → Display Matching Order Details

Userflow Diagram:

4. Acceptance Criteria

- A Product filter is available on the Agent Performance Details page under the Reports module.
- Users can select a product from the available product list.
- When a product is selected, all existing metrics are recalculated based on the matching order data.
- The order details table displays only orders containing the selected product.
- Orders that do not contain the selected product are excluded from the table.
- The Product filter works in combination with all other existing filters on the page.
- When multiple filters are applied, the metrics and table reflect the combined filter criteria.
- When the Product filter is changed or cleared, all metrics and table records update accordingly.
- If no matching orders are found, the metrics display the appropriate zero or empty values, and the table displays an appropriate empty state.
- Existing page functionality and metrics remain unchanged when the Product filter is not applied.

4. Expected Flow

Reports → Agent Performance Details → Select Product → Apply Combined Filters → Recalculate All Metrics → Display Matching Order Details

5. Expected Outcome

The Operations team can evaluate agent performance for a specific product, review the relevant orders, and analyze performance alongside other available filtering criteria.
