Business Requirements Document (BRD)

Google Analytics Integration

Author:
Akib Rahman
Falaq Food

1. Objective

Integrate **Google Analytics 4 (GA4)** with the Falaq Food ERP/CRM system so authorized users can view key ecommerce website analytics directly from the ERP.

2. Business Requirement

The ERP should provide an **Analytics** section that retrieves data from the connected Falaq Food GA4 property and displays website traffic, engagement, and ecommerce performance.

3. User Story

As an authorized ERP user,
I want to view Falaq Food's Google Analytics data within the ERP,
so that I can monitor website traffic, customer engagement, and ecommerce performance without accessing Google Analytics separately.

4. Core Features

- Add an **Analytics** section to the ERP.
- Connect the ERP with the Falaq Food GA4 property.
- Provide date-range filtering.
- Display overview metrics: Users, Sessions, Page Views, Engagement Rate, and Average Engagement Time.
- Display traffic sources/channels.
- Display ecommerce metrics: Product Views, Add to Cart, Begin Checkout, Purchases, and Revenue.
- Display top-performing products and pages.
- Provide loading, empty-data, and error states.
- Restrict Analytics access to authorized users.

5. User Flow

ERP Login → Reports Module → Permission Check → Analytics Dashboard → Select Date Range → Fetch GA4 Data → Display Analytics

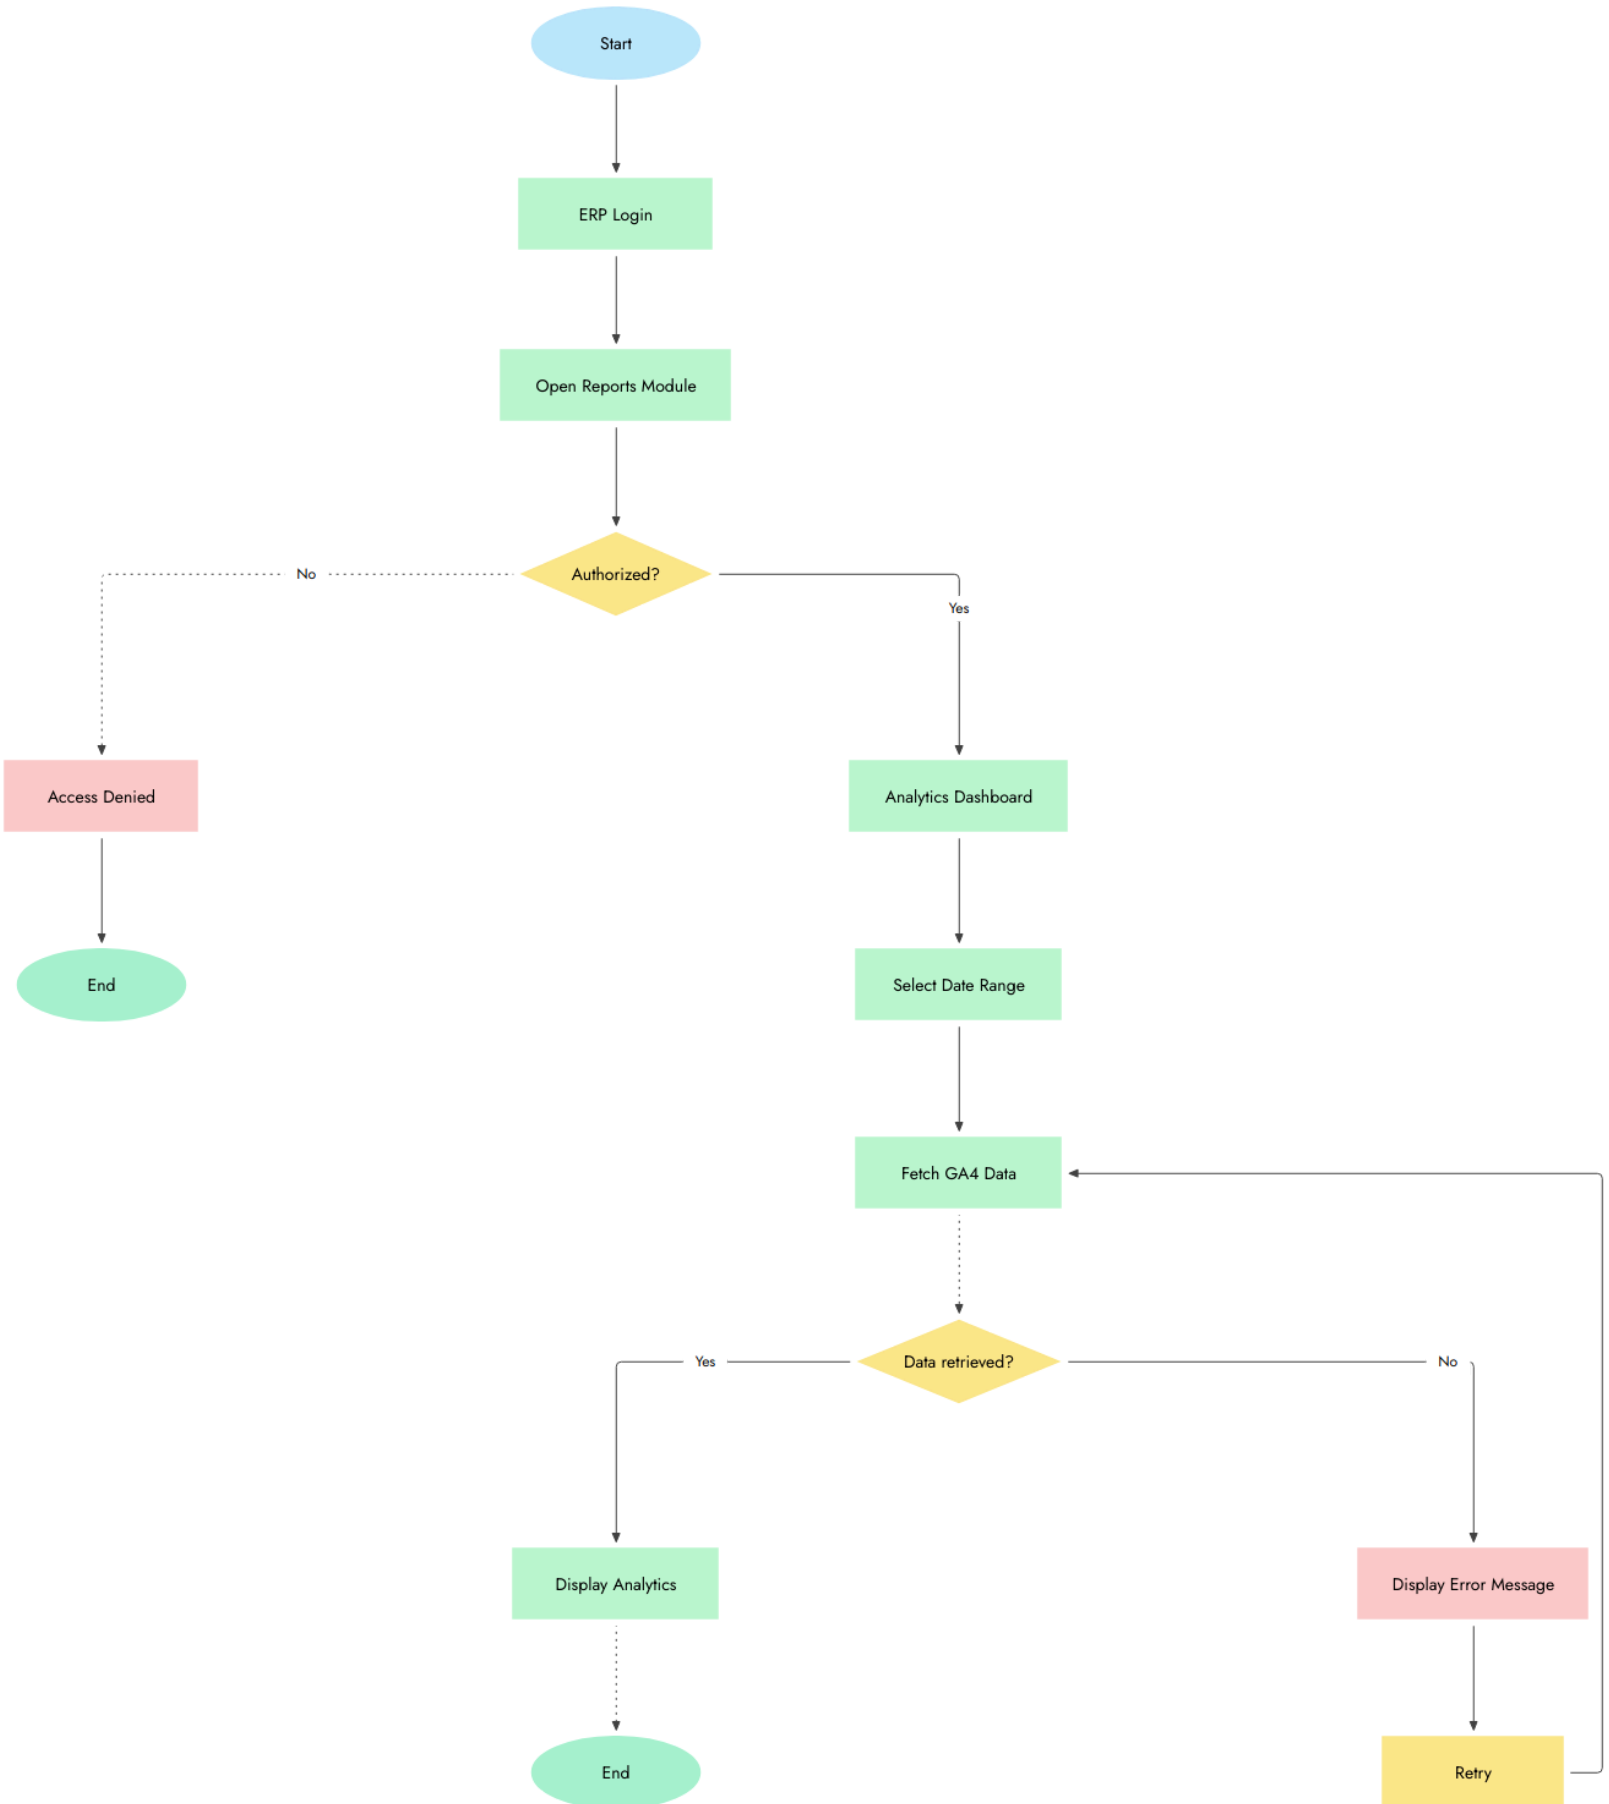

If the user is unauthorized:

Reports Module → Permission Check → Access Denied

If data retrieval fails:

Fetch GA4 Data → API Error → Display Error Message → Retry

User Flow Diagram:

6. Data Integration

- Retrieve GA4 data through the **Google Analytics Data API**.
- GA4 credentials/tokens must not be exposed to the frontend.
- Handle API errors and unavailable data gracefully.

7. Acceptance Criteria

- Authorized users can access the Analytics section; unauthorized users cannot.
- GA4 data is successfully retrieved and displayed in the ERP.
- Users can filter analytics data by predefined and custom date ranges.
- Overview, traffic, ecommerce, product, and page metrics are displayed correctly.
- Displayed data matches the corresponding GA4 API data for the selected date range.
- Loading, empty, and API error states are handled properly.
- GA4 credentials are securely handled through the backend.
- Analytics data is not accessible through unauthorized ERP APIs or direct URLs.

8. Future Scope

- Date-range comparison
- Real-time analytics
- Device and geographic analytics
- Campaign/UTM performance
- Conversion funnel
- Google Ads integration
- Report export
- ERP order vs. GA4 purchase/revenue comparison

9. Business Outcomes

- Provides centralized visibility of website performance within the ERP.
- Reduces the need to switch between ERP and Google Analytics.
- Helps Marketing and SEO teams monitor traffic and user engagement.
- Helps management track ecommerce performance and revenue trends.
- Enables data-driven decisions using website analytics.
- Creates a foundation for future integration between **GA4 data and ERP order/customer data**.
