Business Requirements Document (BRD)

Add Extra Bucket Metric to Product Performance Page

Module: Reports → Products Performance

Author:

1. Objective

Add an **Extra Bucket** metric to the Product Performance page so the Inbound Team Lead can track how many products were sold as Extra Bucket products based on the selected filters.

2. Business Requirement

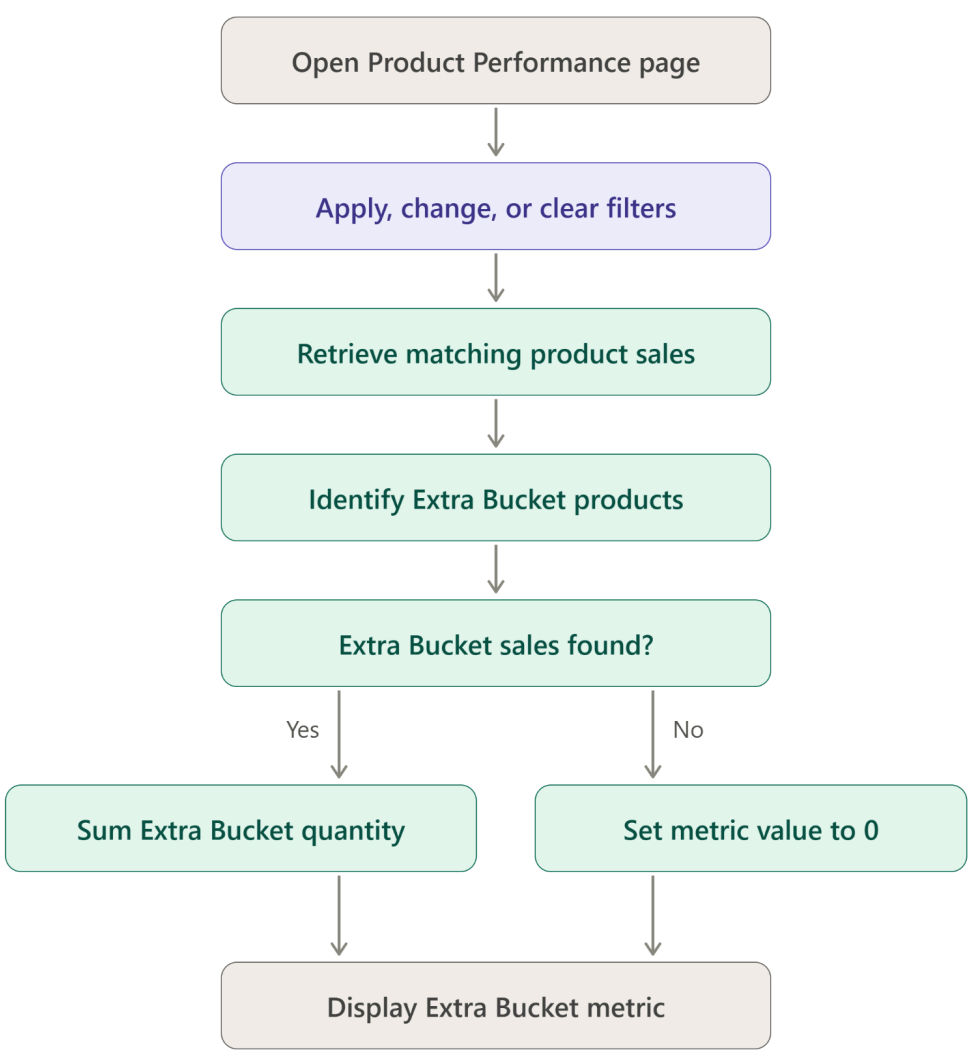

The Product Performance page should include a new metric named **Extra Bucket**, displaying the total quantity of products sold as Extra Bucket products.

The metric must respond dynamically to all available filters on the Product Performance page. When a user applies or changes any filter, the Extra Bucket metric should update accordingly.

3. Expected Flow

Product Performance Page → Apply Filters → Retrieve Matching Product Sales → Identify Extra Bucket Products → Calculate Total Quantity → Display Extra Bucket Metric

UserFlow Diagram:

4. Acceptance Criteria

- An **Extra Bucket** metric is displayed on the Product Performance page.
- The metric displays the total quantity of products sold as Extra Bucket products within the selected filter criteria.
- The metric respects all available filters on the page, including date range, product, category, or other existing filters, where applicable.
- When multiple filters are applied simultaneously, the metric reflects the combined filter criteria.
- When a filter is changed or cleared, the metric updates accordingly.
- The metric follows the same data refresh and filtering behavior as the existing Product Performance metrics.
- If no matching Extra Bucket product sales are found, the metric displays `0`.
- The metric must count only products that qualify as Extra Bucket products, excluding other product sales.

5. Expected Outcome

The Inbound Team Lead can monitor Extra Bucket product sales and analyze performance across different products, categories, dates, and other available filter criteria.
