1. Description

Introduce a feature that allows agents to upload and manage images for each individual product variation from the ERP system. These variant-specific images will be displayed on the e-commerce website under the main product section, alongside the corresponding variation options.

2. Definition

The Product Variant Image Upload feature enables authorized agents to upload, update, and manage images for individual product variants through the **Catalog → Products → Variants** page. Each uploaded image must be associated with its specific product variation and displayed on the e-commerce website under the relevant main product.

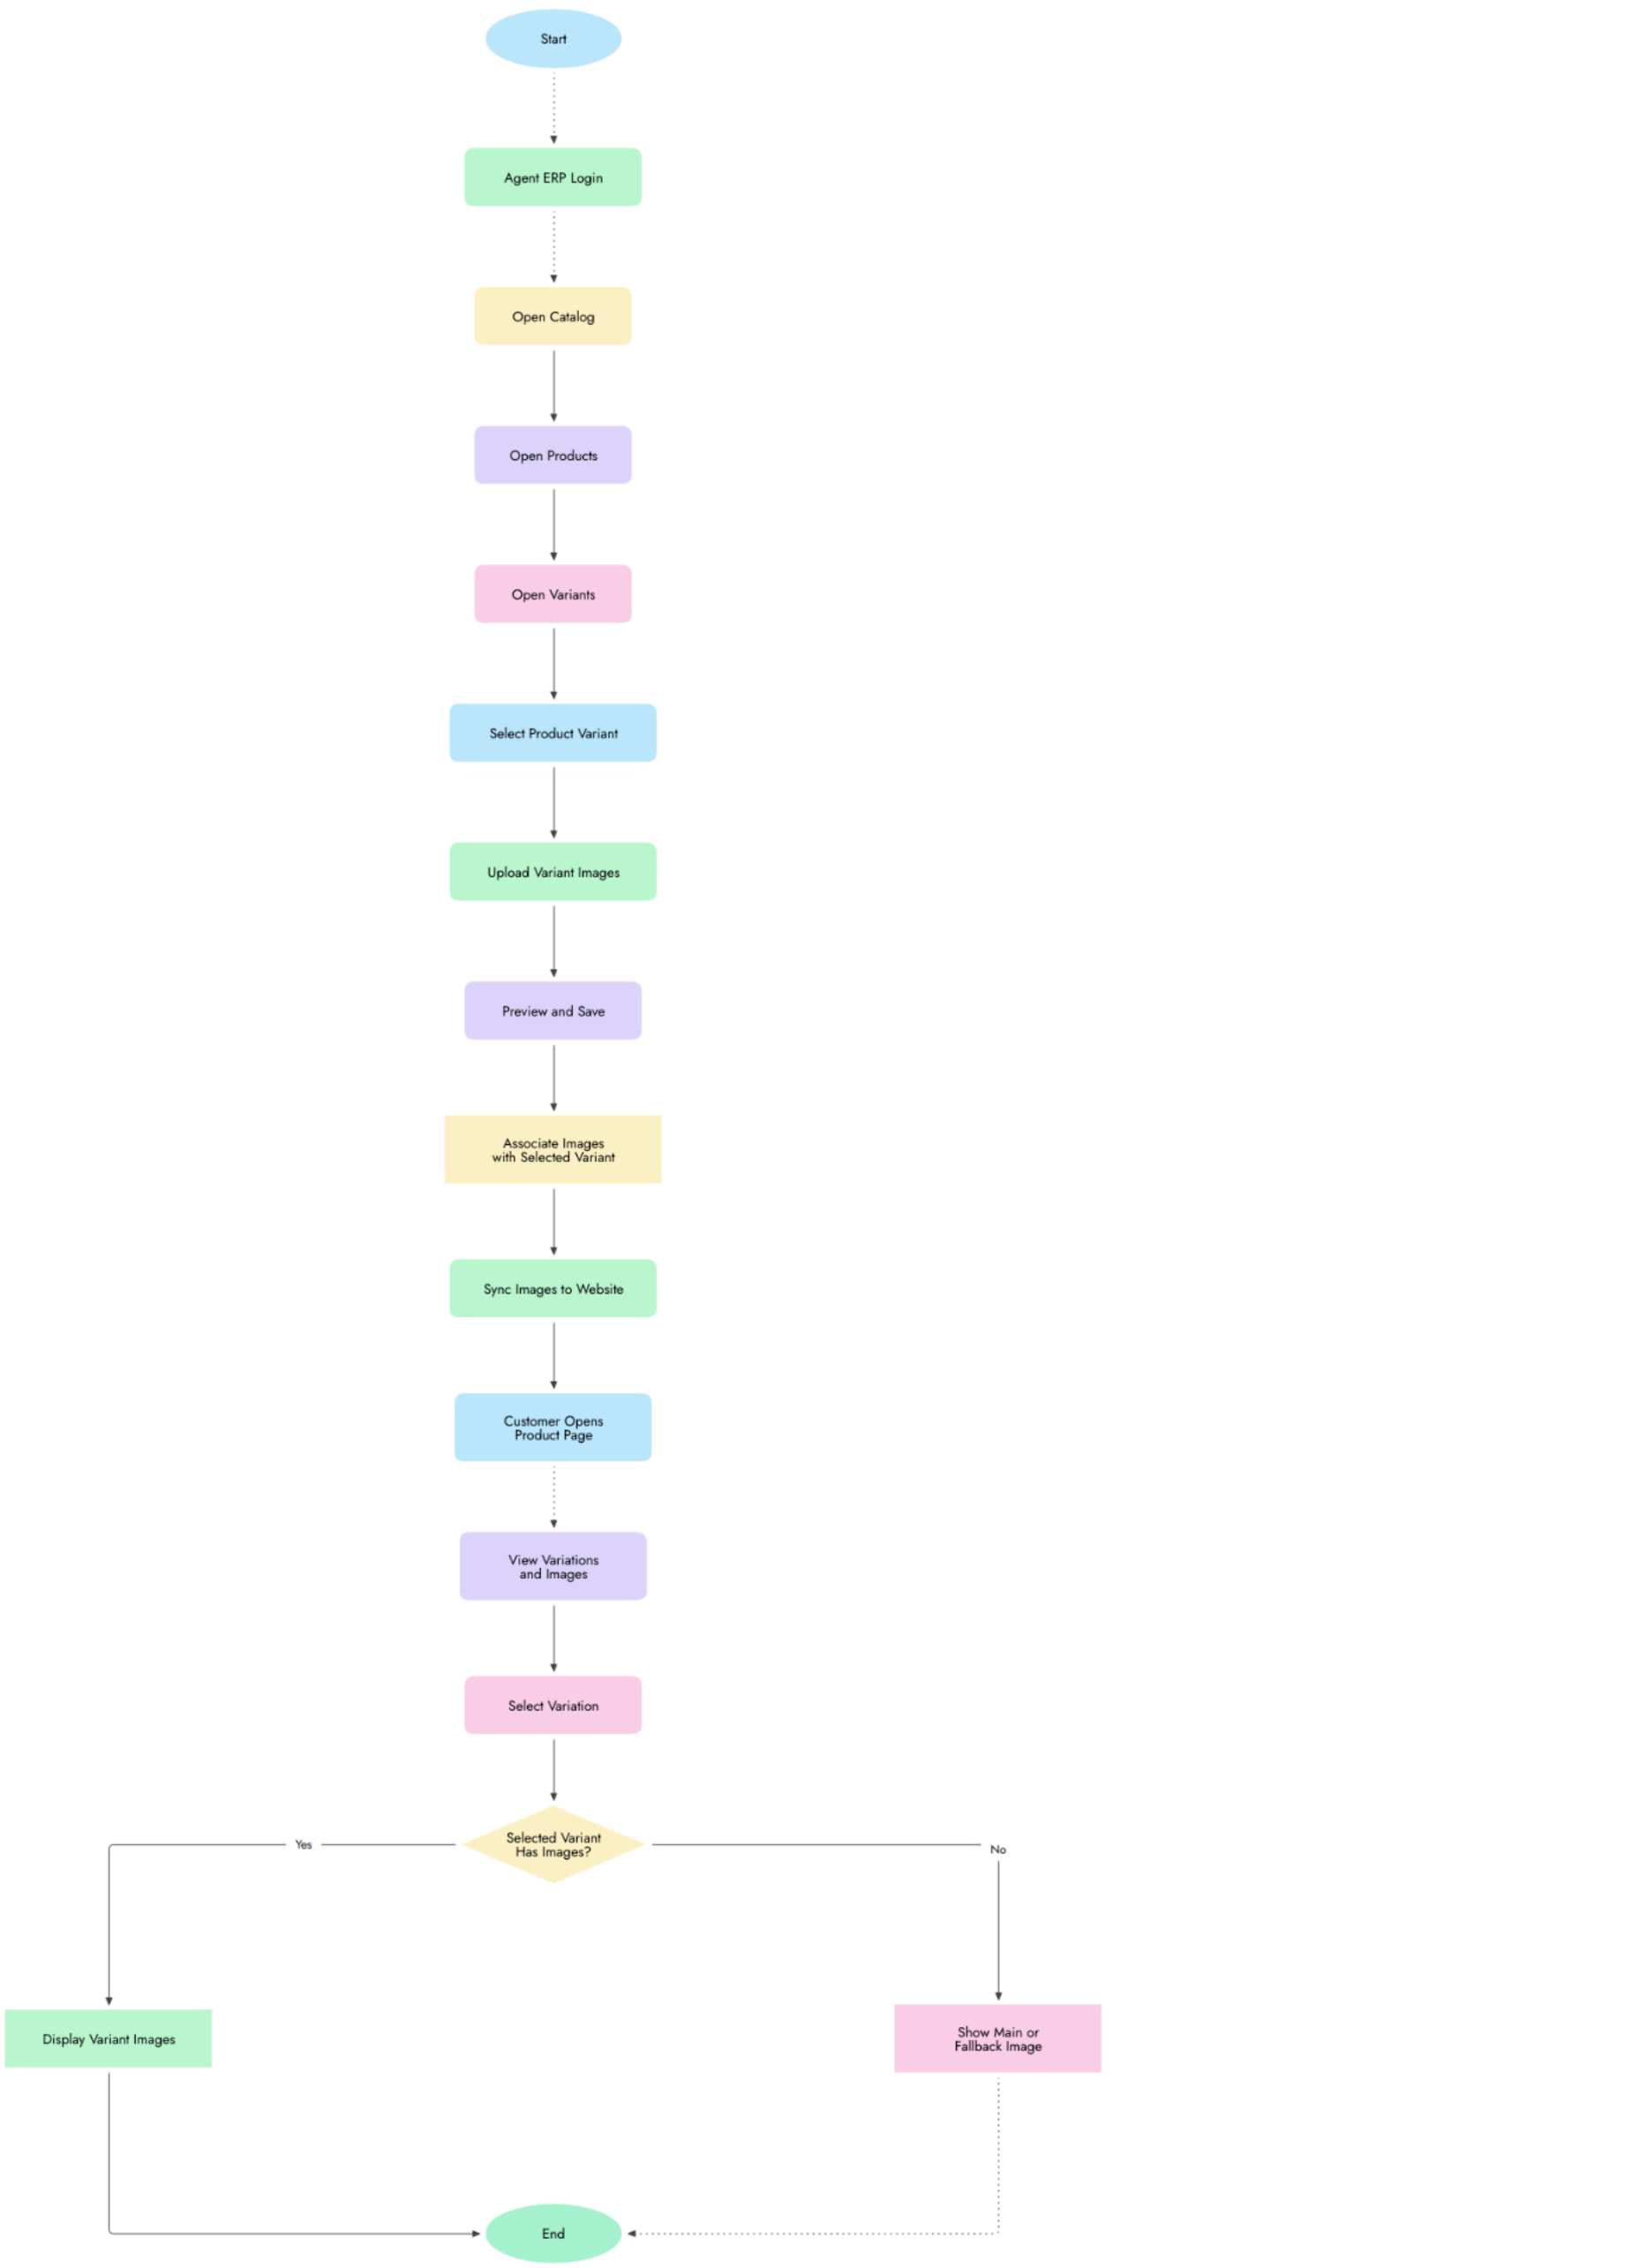

3. Functional Requirements

1. **Image Upload:** Agents can upload one or more images for each product variant from the Variants page.
2. **Variant-Specific Association:** Each image must be linked to the correct product variant, such as a specific color, size, or design.
3. **Image Management:** Agents can view, replace, or remove uploaded variant images, subject to their permissions.
4. **E-commerce Display:** Variant images must appear under the main product on the product detail page, alongside the corresponding variation options.
5. **Dynamic Image Display:** When a customer selects a variation, the e-commerce website should display the images associated with that variation.
6. **Fallback Behavior:** If a variant has no specific image, the website should display the main product image or another configured default image.
7. **Data Synchronization:** Images uploaded or updated in the ERP should be reflected on the e-commerce website after the normal synchronization process.

4. User Flow

1. Agent logs in to the ERP system.
2. Navigates to **Catalog → Products → Variants**.
3. Select the product variant they want to update.
4. Uploads one or more images for the selected variant.
5. Previews the images and saves the changes.
6. The ERP saves the images against the selected product variant.
7. The images synchronize with the e-commerce website.
8. Customers visit the main product page and see the available variations with their respective images.
9. When a customer selects a variation, the corresponding images are displayed.

UserFlow Diagram:

7. Acceptance Criteria

- Agents can upload images for individual product variants.
- Images remain associated with the correct variant.
- Uploaded images appear under the corresponding main product on the e-commerce website.
- Selecting a variation displays the correct images.
- Variants without images use the configured fallback image.
- Updating or deleting a variant image is reflected on the website.
- Existing product images and variant functionality continue to work as expected.

8. Business Outcome

Agents can manage product variation images directly from the ERP, and customers can view accurate, variation-specific images on the e-commerce website before making a purchase. This improves product presentation, reduces confusion between variations, and supports better purchase decisions.
This feature will help customers visually identify each variation, such as different colors, designs, or styles, before selecting or purchasing a product.
