

Business Requirements Document (BRD)

Category Description Feature

Author:
- Akib Rahman
Falaq Food

1. Objective

Add a **Description** field to the **ERP/CRM → Catalog → Categories → Edit Category** page so the SEO/Content team can add detailed, SEO-friendly content for each product category.

The description will be maintained from the ERP/CRM and displayed on the corresponding category page of the **Falaq Food ecommerce website**.

2. Business Requirement

The system should allow authorized users to create and update a category description, similar to the existing product description functionality.

The Description field should support the existing content/formatting capabilities available in the product description editor, where applicable.

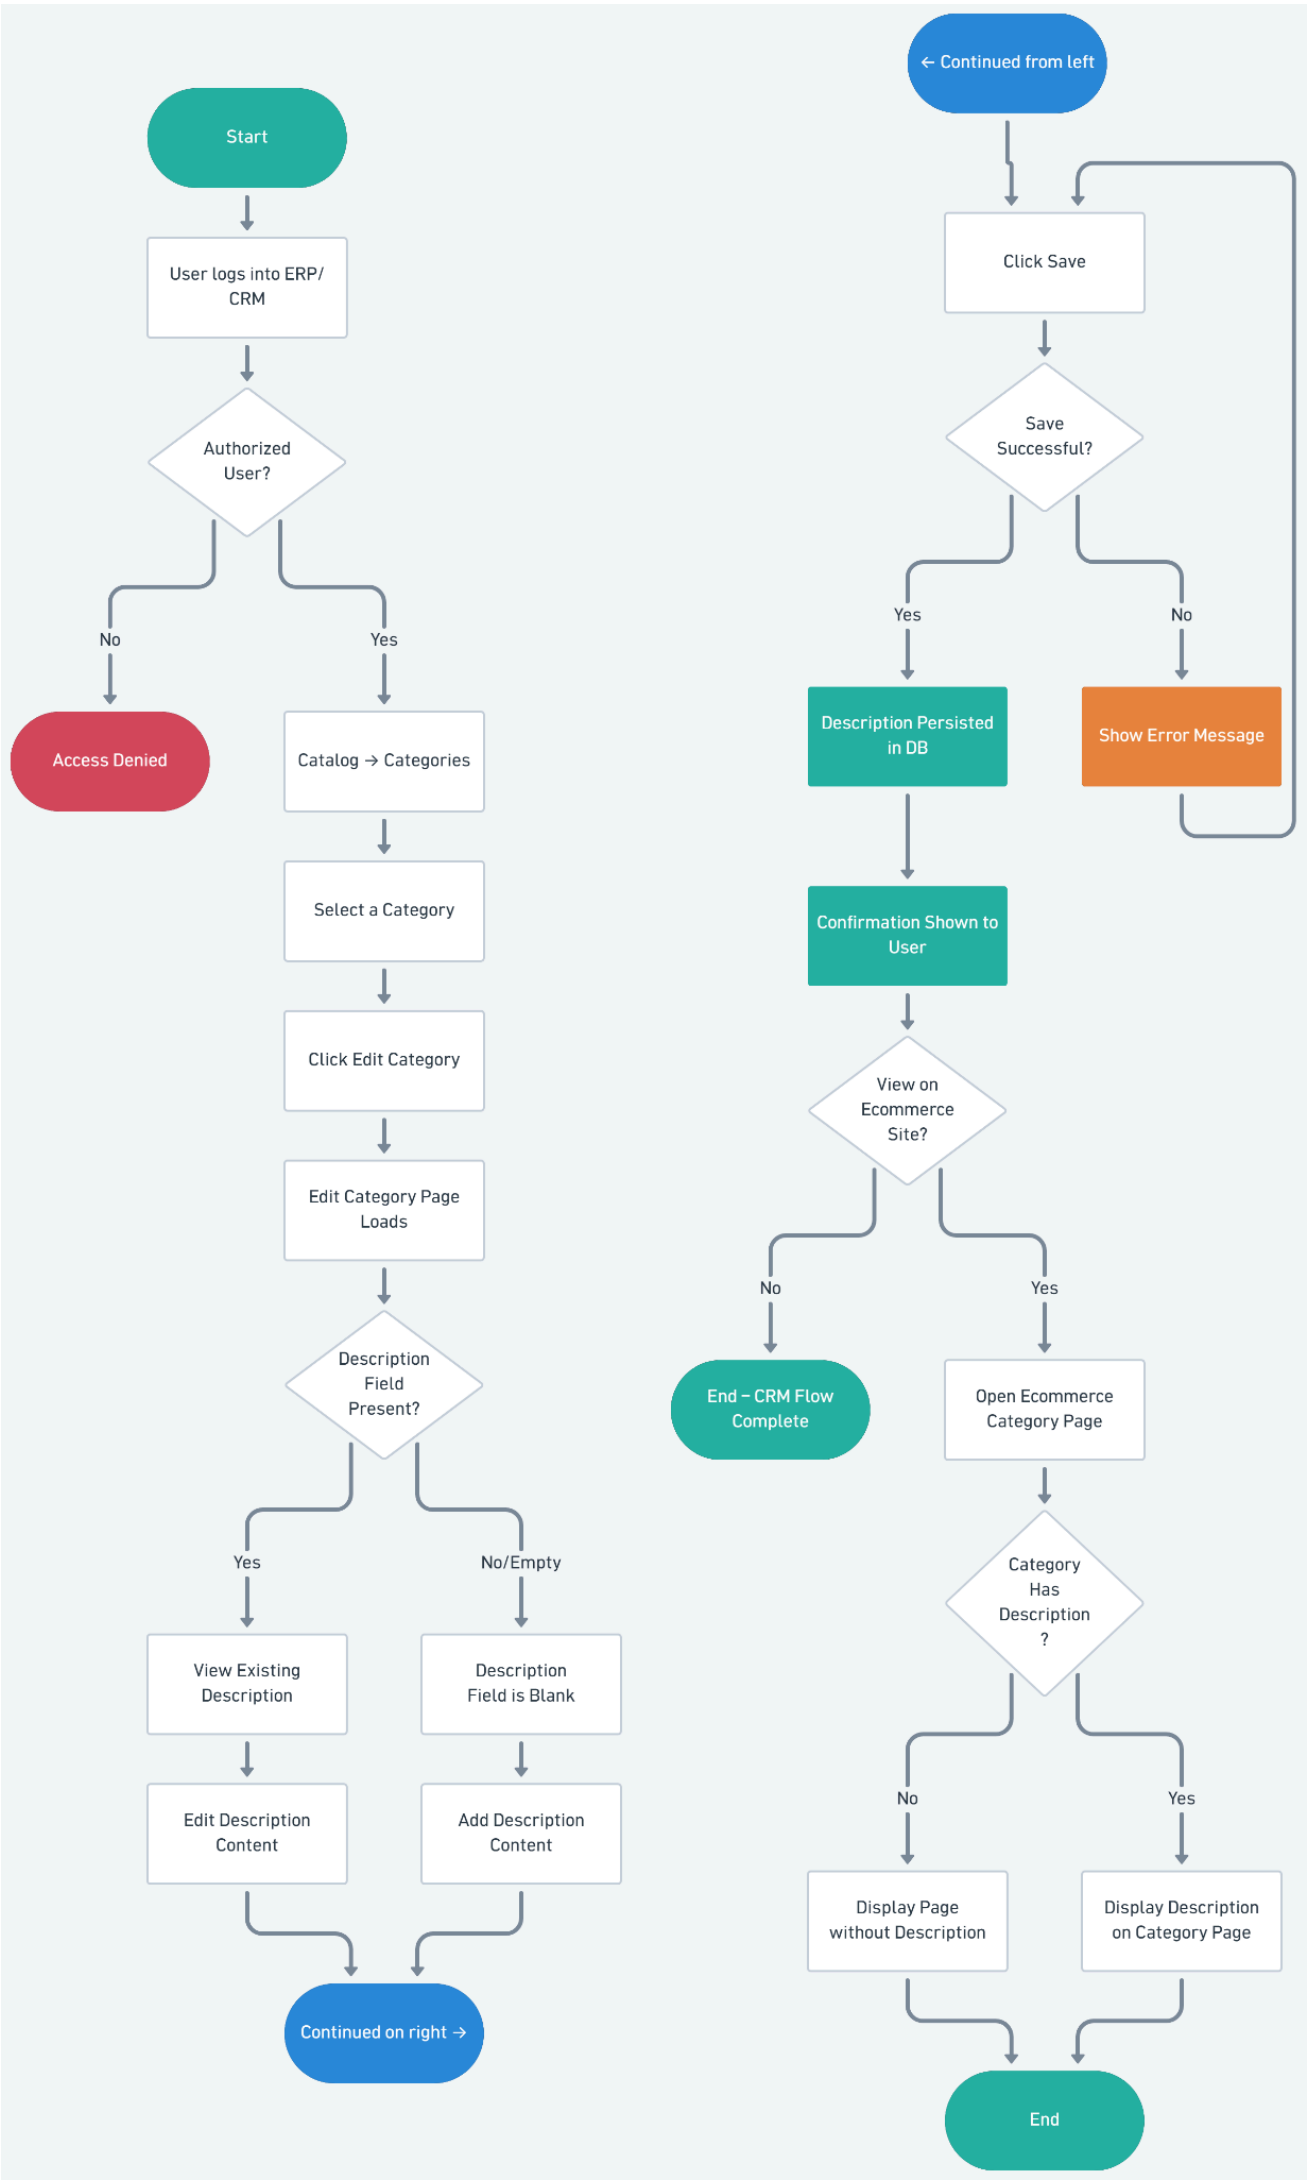

The saved description will be associated with the relevant category and displayed on its corresponding ecommerce category page.

3. Scope

- Add a **Description** input/editor to the Edit Category page.
- Allow authorized users to **add, edit, and remove** category descriptions.
- Store the description against the corresponding category.
- Ensure the description persists after saving, refreshing, or reopening the category.
- Display the saved description on the related ecommerce category page.
- Display the description at the designated location agreed by the Business/UX team.
- Ensure the description is correctly synchronized/published from ERP/CRM to the ecommerce website.
- Existing categories without a description should continue to work normally.
- Existing product descriptions and category functionality should remain unaffected.

4. Expected Flow

ERP/CRM → Catalog → Categories → Edit Category → Add/Edit Description → Save → Description Stored/Synchronized → Ecommerce Category Page → Description Displayed

5. Acceptance Criteria

- Description field is available when editing a category.
- Authorized users can enter, update, and remove category description content.
- Saved content persists after refreshing/reopening the category.
- Updated description appears on the corresponding ecommerce category page.
- Description is displayed at the designated location on the category page.

- The description is displayed against the correct category.
- Supported formatting/content is displayed correctly on the ecommerce website.
- Empty description is allowed where applicable.
- Categories without a description continue to work normally without displaying an empty section.
- Existing category and product functionality remains unaffected.
- Existing user permission/authorization rules are respected.

6. Out of Scope

- Changes to existing product descriptions.
- Changes to category structure or category management.
- Automatic generation of SEO content.
- Changes to Meta Title, Meta Description, URL/Slug, or other SEO metadata.
- Bulk upload of category descriptions.
- Redesign of the ecommerce category page beyond displaying the description.

7. SEO Requirements

The category description is primarily intended to support SEO and category-page content.

The feature should allow the SEO team to create unique, relevant, and customer-friendly content for each category.

The description should:

- Be editable without requiring a development deployment.
- Support sufficient content length for SEO requirements.
- Be rendered as indexable page content where technically applicable.
- Avoid unnecessary duplication across categories.
- Preserve relevant formatting and links where supported.

8. Business Outcome

After implementation, the SEO/content team will be able to manage category-level content directly from the ERP/CRM without requiring development changes for every new or updated category description.

This will provide the ecommerce website with richer category content, improve the information available to customers, and establish a centralized process for maintaining SEO-friendly category descriptions.
