Falaq Food

1. Objective

Enhance the ERP/CRM → Orders Queue page to identify Ecommerce orders that may be duplicates based on matching customer information.

When an incoming Ecommerce order has the same phone number and same address as another relevant order, the system should identify it as a Possible Duplicate.

Possible duplicate orders should be visually highlighted in the Orders Queue, and a new Possible Duplicate Count should be displayed in the page header.

2. Business Requirement

The system should automatically identify orders that may be duplicates when an Ecommerce order is received with the same phone number and same address as another order.

For orders meeting these criteria:

- The order should be marked as a Possible Duplicate.
- The corresponding order row in the Orders Queue should be displayed with a light red background/highlight.
- The Possible Duplicate Count in the Orders Queue header should increase accordingly.
- The count should represent the number of orders currently identified as Possible Duplicates.
- The identification should happen automatically without requiring manual comparison by the Operations team.

The feature is intended to help the Operations team quickly identify and review potentially duplicate orders before processing them.

3. Scope

- Identify possible duplicate Ecommerce orders based on matching phone number and address.
- Add a Possible Duplicate status/indicator for identified orders.
- Display identified orders with a light red highlight in the Orders Queue table.
- Add a new Possible Duplicate Count to the Orders Queue header.
- Increase the count when an order is identified as a possible duplicate.
- Ensure the count reflects the relevant Possible Duplicate orders in the queue.
- Existing Orders Queue functionality and other order statuses/counts should remain unaffected.

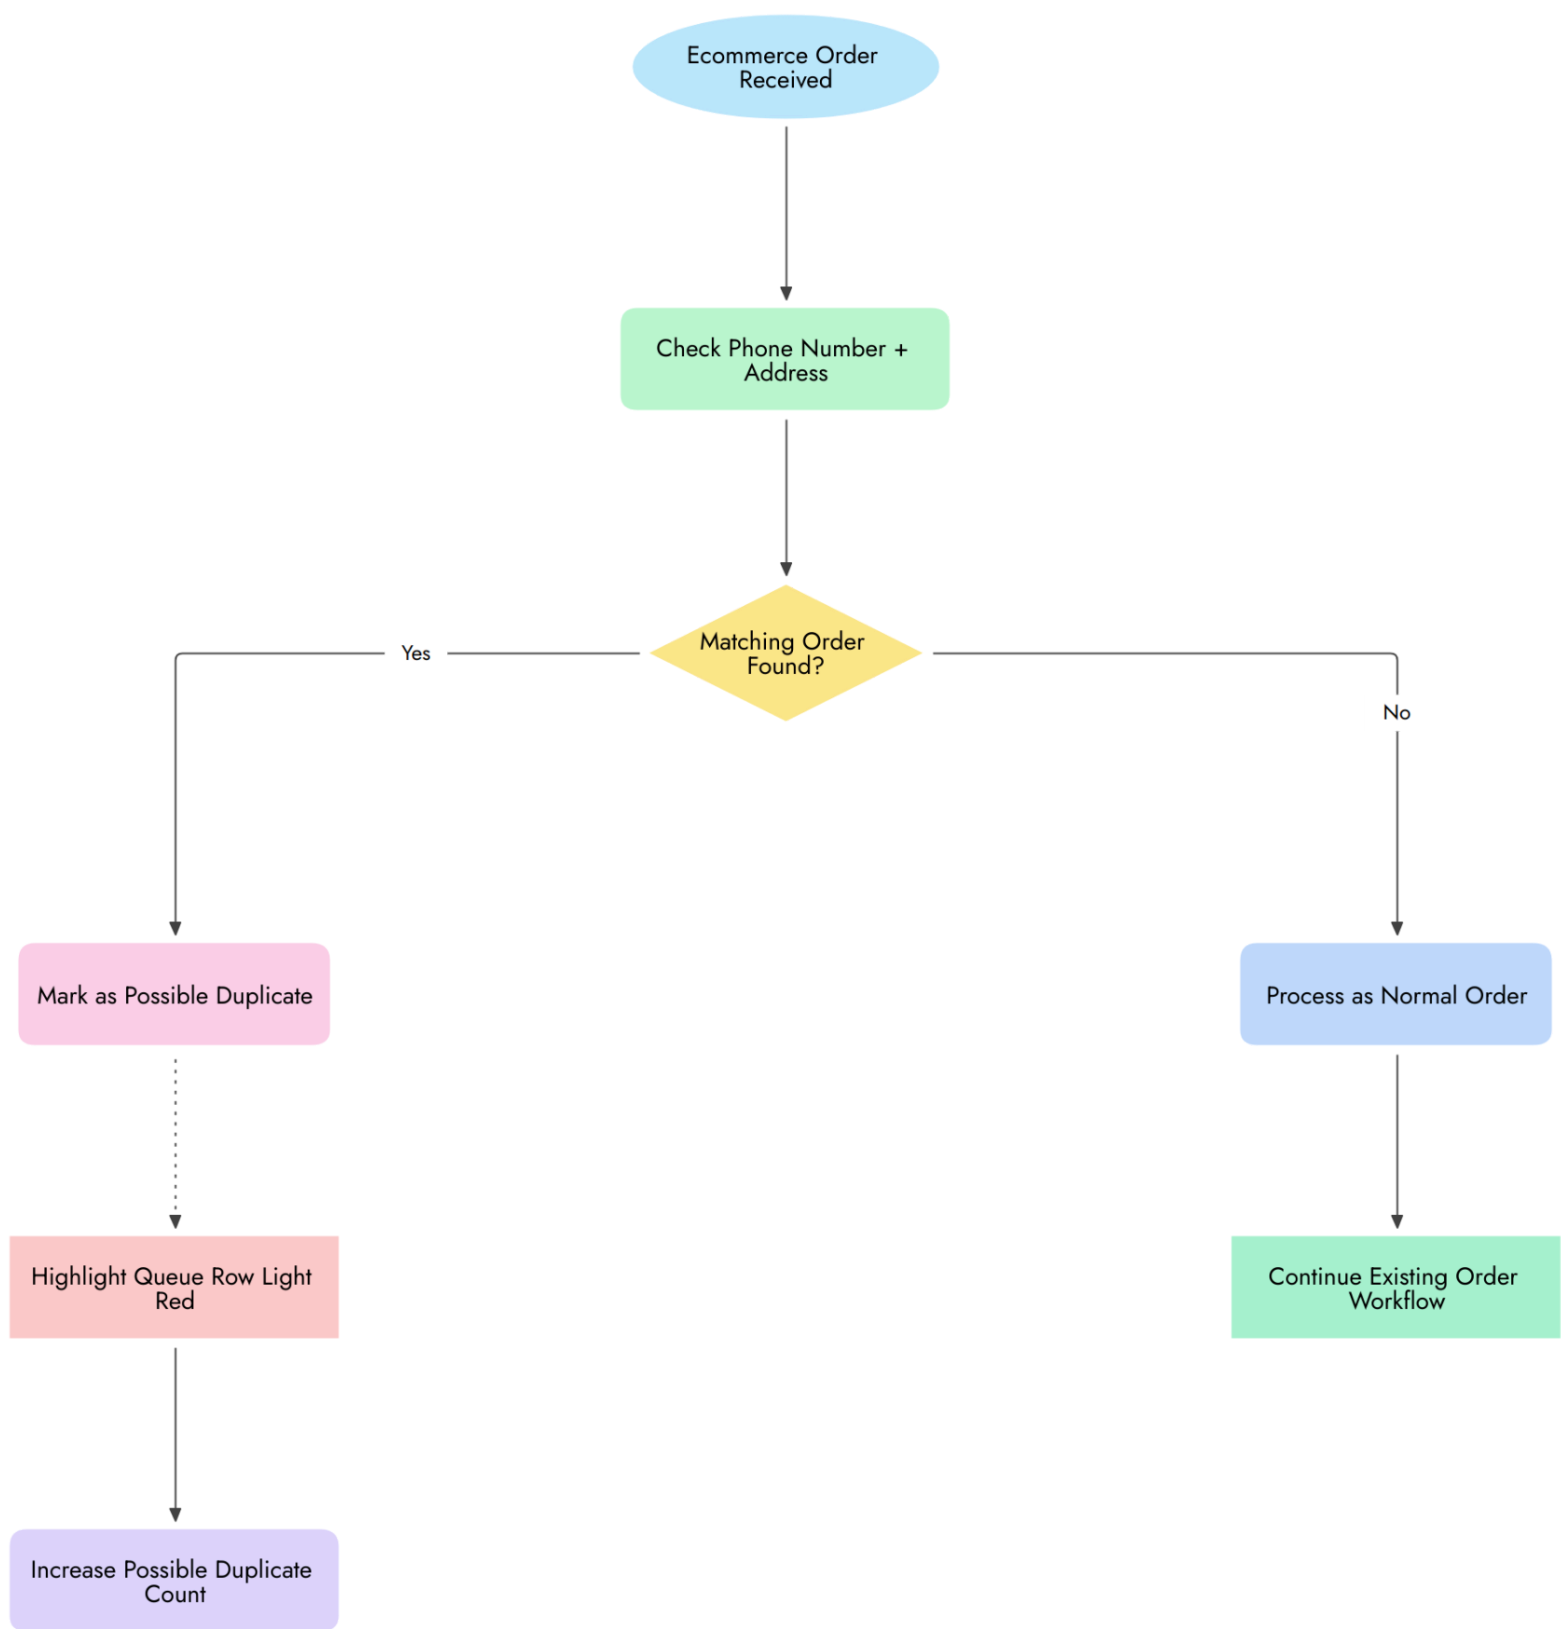

4. Expected Flow

Ecommerce Order Received → Check Phone Number + Address → Match Found → Mark as Possible Duplicate → Highlight Order Light Red → Increase Possible Duplicate Count

If no matching order is found:

Ecommerce Order Received → Check Phone Number + Address → No Match → Process as Normal Order

User Flow Diagram:

5. Acceptance Criteria

- System identifies an order as a Possible Duplicate when the defined phone number and address match another relevant order.
- Possible Duplicate orders are displayed with a light red highlight in the Orders Queue table.
- A new Possible Duplicate Count is displayed in the Orders Queue header.
- Possible Duplicate Count increases correctly when a qualifying order is identified.
- Possible Duplicate Count reflects the relevant Possible Duplicate orders in the queue.
- The Possible Duplicate Count updates correctly when the underlying order status/data changes, as applicable.
- Orders that do not meet the duplicate criteria are not marked as Possible Duplicates.
- Existing Orders Queue functionality, columns, filters, and other counts remain unaffected.
- The visual treatment of the Possible Duplicate order is clear and distinguishable from normal orders.

6. Out of Scope

- Automatic cancellation of duplicate orders.
- Automatic merging of duplicate orders.
- Changes to customer information.
- Changes to the existing order creation process.
- Changes to existing order confirmation or cancellation rules.
- Manual duplicate review workflow beyond the identification and highlighting requirement.
- Duplicate detection based on criteria other than the defined phone number and address matching.

7. Business Outcomes

- Help the Operations team quickly identify potentially duplicate Ecommerce orders.
- Reduce the risk of processing the same customer order multiple times.
- Provide clear visibility of Possible Duplicate orders directly within the Orders Queue.
- Allow the team to prioritize review of potentially duplicate orders.
- Provide a quick overview of the number of Possible Duplicate orders through the new header count.
- Improve order-processing accuracy while keeping the existing order workflow unchanged.
