Falaq Food

1. Objective

Enhance the Operational Dashboard by adding a Not Started column to the agent-level operational table.

The column will show the number of orders assigned to each agent that are still Pending and have no disposition provided by the agent, helping the Operations Team Lead identify orders that have not yet been worked on.

2. Business Requirement

The Operational Dashboard should provide a Not Started count for each agent.

An order should be considered Not Started when:

- The order is assigned to the respective agent.
- The order is currently in Pending status.
- The agent has not provided any disposition for the order.

Orders that are Pending but have already received at least one disposition from the assigned agent should not be included in the Not Started count.

The count should be displayed separately for each agent in the Operational Dashboard table.

3. Scope

- Add a Not Started column to the agent-level table in the Operational Dashboard.
- Calculate the Not Started count for each agent based on their assigned orders.
- Include only orders that are currently in Pending status and have no disposition from the assigned agent.
- Exclude Pending orders where the agent has provided at least one disposition.
- Ensure the count reflects the correct agent-to-order assignment.
- Update the count according to the existing dashboard date/filter criteria, where applicable.
- Existing dashboard columns, metrics, and functionality should remain unaffected.

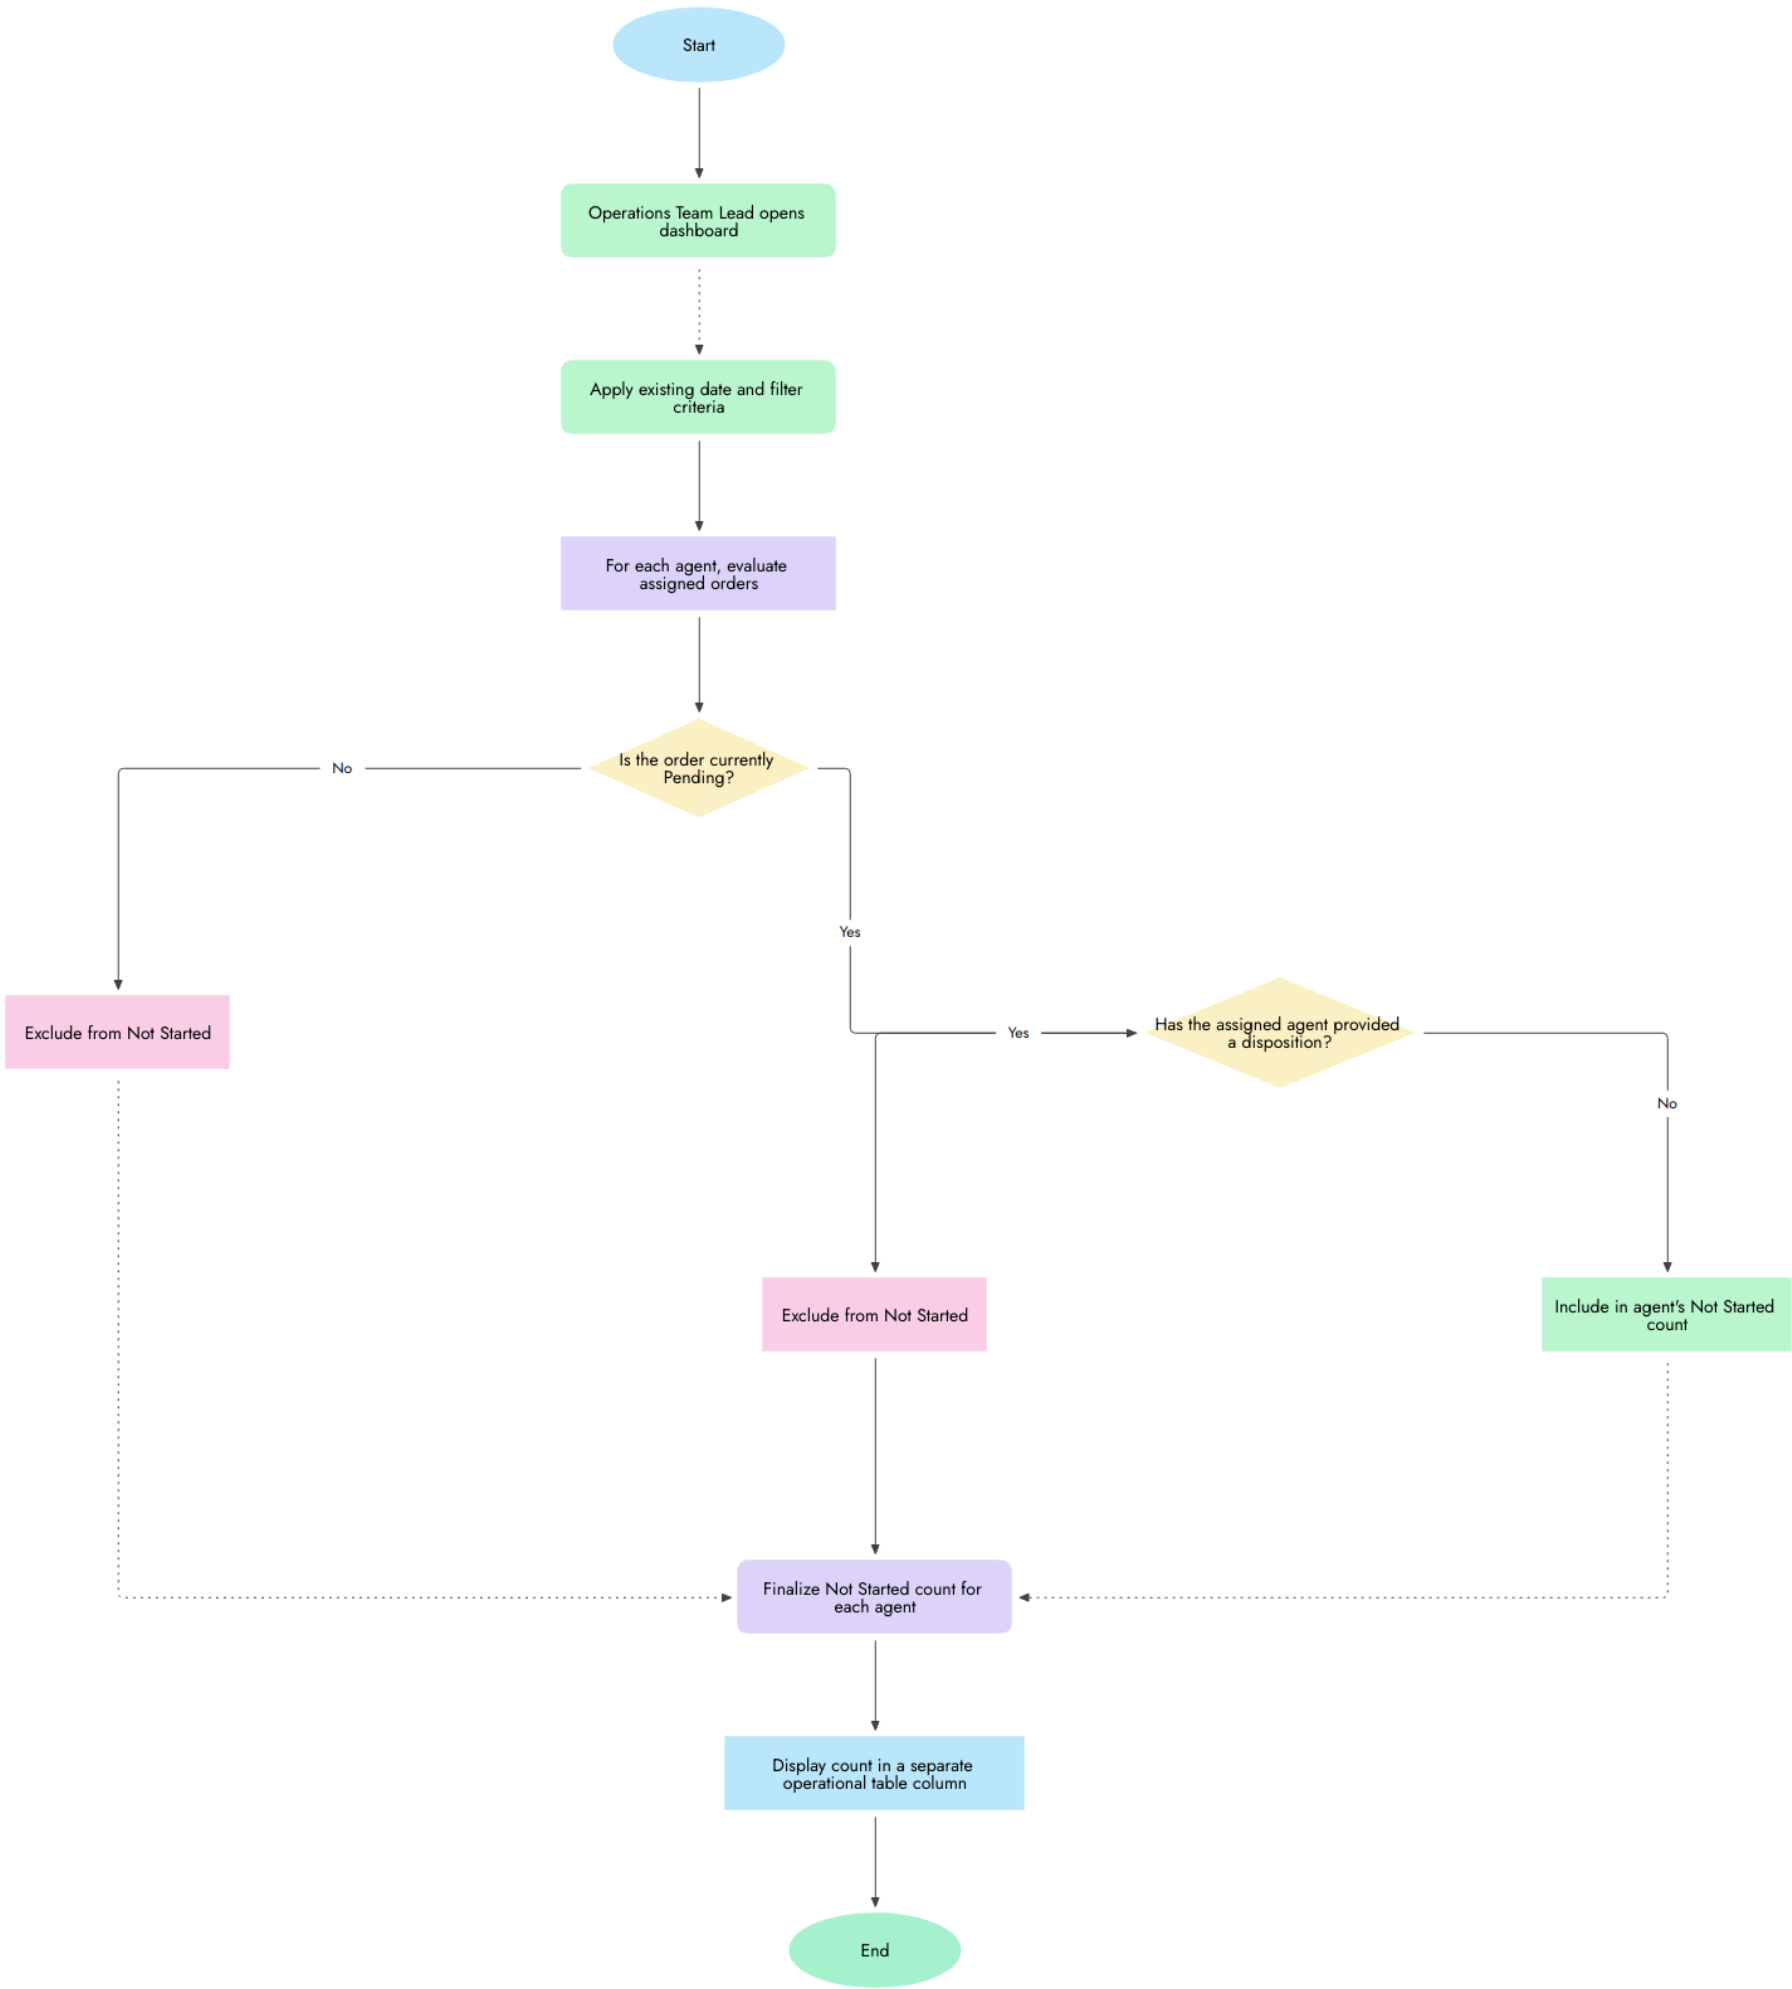

4. Expected Flow

Operational Dashboard → Agent Table → Check Assigned Orders → Pending Status + No Agent Disposition → Include in Not Started Count → Display Count Against Agent

For a Pending order with a disposition:

Assigned to Agent → Pending → At Least One Disposition Provided → Exclude from Not Started

User flow diagram:

5. Acceptance Criteria

- A Not Started column is available in the Operational Dashboard agent table.
- The column displays a count for each agent.
- Only orders assigned to the respective agent are considered.
- Only orders with Pending status and no disposition from the agent are included.
- Pending orders with at least one agent-provided disposition are excluded.

- The Not Started count is calculated correctly for each agent.
- The count updates correctly when relevant order/agent data changes.
- The count follows applicable dashboard date ranges and filters.
- Existing dashboard metrics and columns remain accurate and unaffected.
- The Not Started count provides a clear indication of orders assigned to an agent but not yet worked on.

6. Out of Scope

- Changes to the existing order assignment process.
- Changes to order status definitions.
- Changes to disposition creation or management.
- Automatic assignment or redistribution of Not Started orders.
- Changes to other Operational Dashboard metrics.
- Changes to the agent workflow for processing orders.

7. Business Outcomes

- Give the Operations Team Lead clear visibility into orders that agents have not yet started working on.
- Help identify pending workload at an individual agent level.
- Make it easier to monitor whether assigned orders are being actioned.
- Reduce the risk of assigned orders remaining unattended.
- Provide a clear distinction between orders that are genuinely not started and Pending orders that have already been worked on.
- Improve operational monitoring and workload management through the Operational Dashboard.
