Fresh & Old Confirmed Order Breakdown Feature

Author:
Akib Rahman
Falaq Food

1. Objective

Enhance the **Operational Dashboard** → **Working Orders** section to provide a clear breakdown of confirmed orders into **Fresh Orders** and **Old Orders**.

This will provide the Operations team with better visibility into the composition of Working Orders and help them understand how many confirmed orders are Fresh versus Old within the selected date range.

2. Business Requirement

Currently, the **Working Orders** section displays an overall count of working orders without providing a breakdown based on Fresh and Old order types.

The system should provide separate counts within the Working Orders section for:

- **Fresh Orders Confirmed**
- **Old Orders Confirmed**

The breakdown should be calculated based on the selected dashboard date range and should remain consistent with the existing Working Orders total.

The visual representation of these counts should be finalized in discussion with the **UI/UX team** to ensure the comparison is easy to understand at a glance.

3. Scope

- Add a **Fresh Orders Confirmed** count within the Working Orders section.
- Add an **Old Orders Confirmed** count within the Working Orders section.
- Calculate both counts based on the selected dashboard date range.
- Ensure the existing **Working Orders total** remains accurate.
- Ensure Fresh and Old order counts are clearly distinguishable.
- Update the breakdown when the dashboard date range is changed.
- Ensure the Fresh + Old confirmed order breakdown is consistent with the relevant Working Orders data.
- Finalize the visual representation in consultation with the UI/UX team.
- Existing Operational Dashboard functionality should remain unaffected.

4. Expected Flow

Operational Dashboard → **Select Date Range** → **Working Orders** → **View Total Working Orders** → **View Fresh Orders Confirmed + Old Orders Confirmed Breakdown**

When the date range is changed:

Change Date Range → **Recalculate Working Orders** → **Recalculate Fresh/Old Breakdown** → **Display Updated Counts**

User Flow Diagram:

5. Acceptance Criteria

- **Fresh Orders Confirmed** count is displayed within the Working Orders section.
- **Old Orders Confirmed** count is displayed within the Working Orders section.
- Counts are calculated correctly based on the selected date range.
- Fresh and Old order counts are clearly distinguishable.
- The existing Working Orders total remains accurate.
- Fresh + Old confirmed order counts are consistent with the relevant Working Orders data.
- The breakdown updates correctly when the dashboard date range is changed.
- The counts reflect the correct order classification based on the existing Fresh/Old order logic.
- The final visualization is agreed with the UI/UX team.
- The final design makes the comparison between Fresh and Old confirmed orders easy to understand at a glance.
- Existing dashboard functionality and other dashboard metrics remain unaffected.

6. Out of Scope

- Changes to the existing Working Orders calculation logic unless required for the breakdown.
- Changes to Fresh/Old order classification rules.
- Changes to order confirmation workflow.
- Changes to other Operational Dashboard metrics.
- Changes to order data or order processing functionality.
- Major redesign of the Operational Dashboard beyond the required breakdown.

7. Business Outcomes

- Provide the Operations team with clearer visibility into the composition of Working Orders.
- Help the team quickly understand the distribution of **Fresh vs. Old confirmed orders**.
- Support better operational monitoring and workload analysis.
- Make it easier to identify changes in the Fresh and Old order mix over different date ranges.
- Improve the usefulness of the Operational Dashboard without changing the existing Working Orders functionality.
